Asset Module Help

Asset setup, classification, lifecycle control and operational handoffs

WHAT THIS GUIDE COVERS

Use this guide to understand how LeaseHive establishes an asset record, keeps its identity and operating state current, and supplies reliable asset information to procurement, contracts, service and disposal teams.

MODULE FLOW AT A GLANCE

Configure → Acquire → Register → Operate → Assure → Govern → Dispose

HOW TO READ THIS GUIDE

Data flow image	Shows the controlled sequence and the records that move the work forward.
Entity map	Names the primary records and the role each record plays in the module.
Record guide	Explains the data each stage needs and the decision it makes possible.
Practical guidance	Highlights operational controls and the most important handoffs.

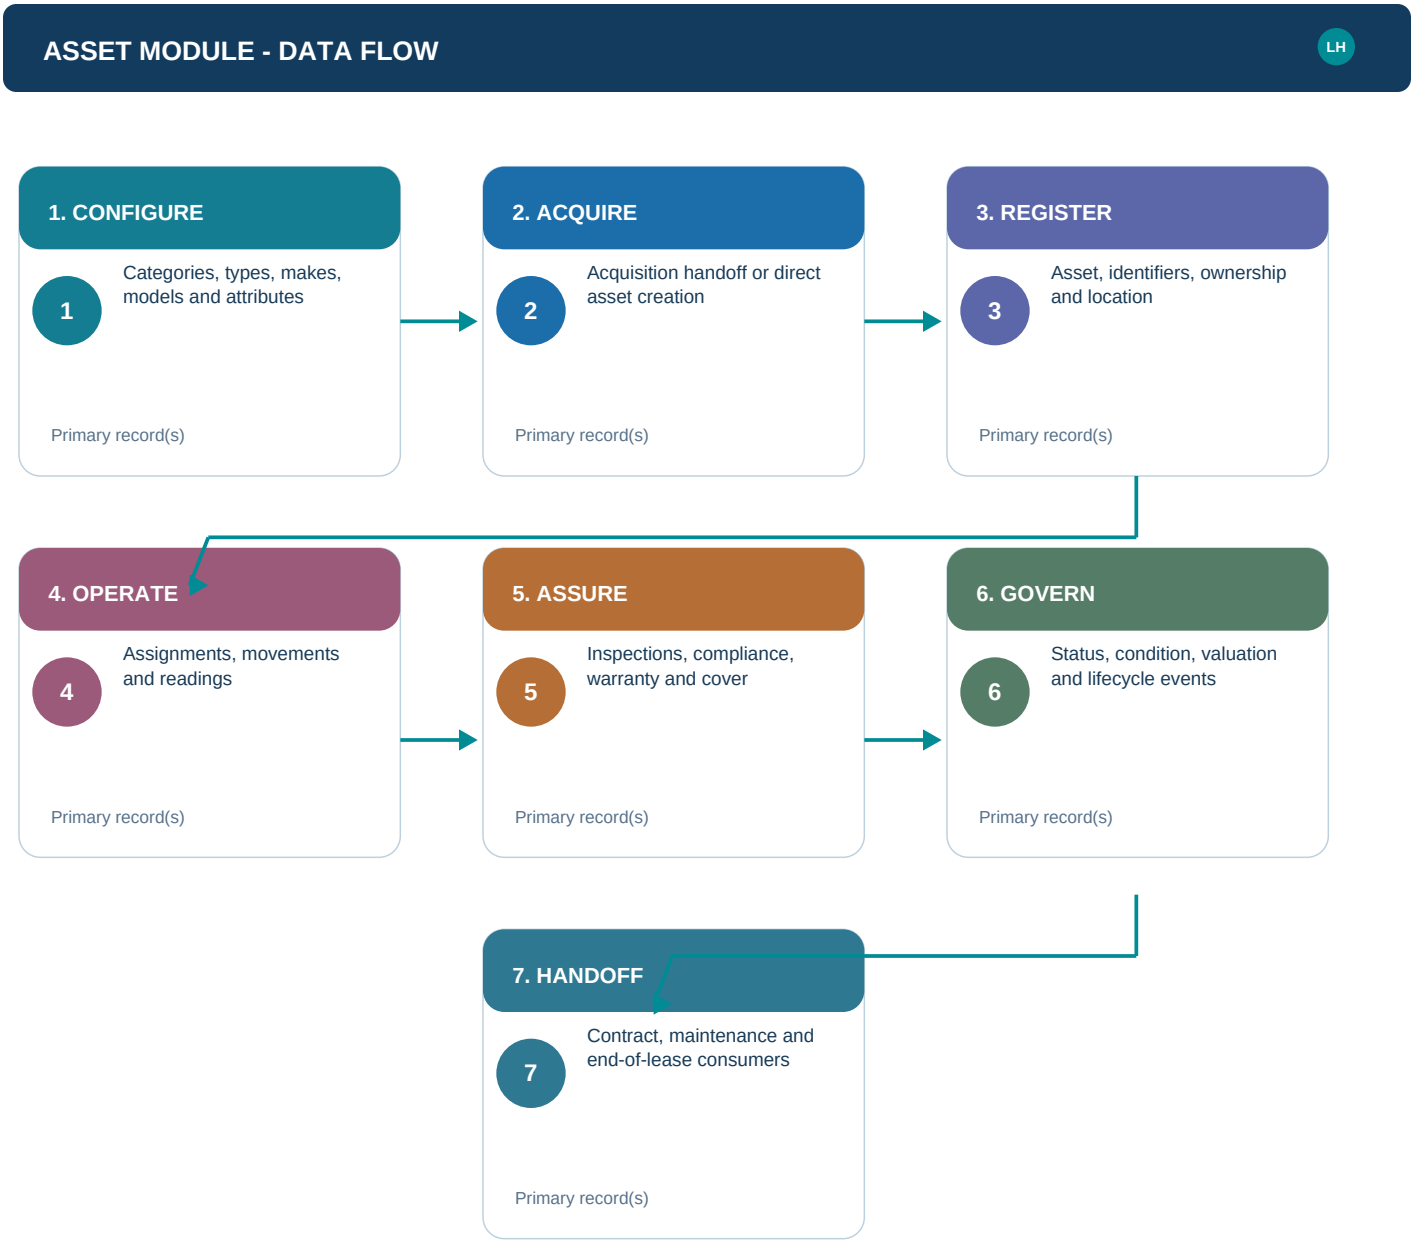
ENTITY MAP

Asset category / type	Defines the classification and available controls for the asset.
Make / model / attributes	Describes the product identity and configurable specifications.
Asset	The operational record joining ownership, condition, state and lifecycle.
Identifiers / history	Tracks serials, tags, locations, assignments and status changes.
Inspection / compliance	Records checks, evidence, due dates and exceptions.
Lifecycle event	Captures valuation, transfer, return and disposal-related milestones.

The data-flow image on the next page is the quickest way to orient a new user before they work in the module.

Asset Data Flow

The primary record flow, with its control points and downstream consumers.



DATA EXCHANGE AND CONTROL POINTS

- Each stage should carry a link to the prior controlled record rather than duplicating its key data.
- Approvals, accepted receipts, execution evidence or financial controls determine when the next stage may proceed.
- Status and history records make the current position, accountable user and audit trail visible across modules.

DATA-FLOW PHASES

Record Guide

What each stage records, and the decision or outcome it supports.

1 Configuration

PRIMARY RECORDS

Asset category, asset type, make, model and attribute definitions

OUTCOME

Create reusable classification data before operational assets are registered.

2 Acquisition and registration

PRIMARY RECORDS

Asset acquisition handoff, asset, identifier and ownership

OUTCOME

Creates a traceable physical or virtual asset with unique identity.

3 Operations

PRIMARY RECORDS

Assignments, transfers, locations, measure readings and condition

OUTCOME

Keeps utilisation and custody information current throughout the life of the asset.

4 Assurance

PRIMARY RECORDS

Inspections, compliance records, warranty and insurance references

OUTCOME

Documents required controls, evidence and coverage obligations.

5 Governance

PRIMARY RECORDS

Statuses, valuation, lifecycle event and history

OUTCOME

Makes the current operating state and material value auditable.

6 Downstream handoffs

PRIMARY RECORDS

Contract assets, work orders and disposal cases

OUTCOME

Shares the same asset identity with modules that operate or retire it.

Use the stage status and linked records together when diagnosing a worklist or handoff issue.

PRACTICAL GUIDANCE

Working with the Asset flow

Use these checks to keep records auditable, useful to downstream teams and ready for reporting.

THE OPERATING PRINCIPLE

Each workflow stage should create or update its own accountable record, retain the decision evidence, and link forward only when its control condition has been met.

CONTROL CHECKS

1. Use identifiers consistently so serial-number and tag searches resolve one asset.
2. Record assignment, location and status changes through their history records, not as informal notes.
3. Review compliance and warranty dates before releasing an asset to a contract or service activity.

DOWNSTREAM HANDOFFS

Contracts consumes allocated assets; Maintenance & Insurance consumes asset condition and coverage context; End-of-Lease & Disposal consumes the asset lifecycle and valuation history.

WHEN A RECORD DOES NOT MOVE FORWARD

- Check the record status and the current owner or worklist.
- Open the linked predecessor record and confirm its approval, receipt, execution or posting condition.
- Review visible exceptions and history before changing data or creating a follow-up record.

This guide is a process reference. Follow your organisation's configured approval, policy and retention requirements.
